

Prove the following languages are context-free by designing context-free grammars which generate them:

$$L_1 = \{a^n b^n c^p : n, p \geq 0\}$$

$$L_2 = \{a^n b^p c^n : n, p \geq 0\}$$

$$L_3 = \{a^n b^m : n \neq m, n, m \geq 0\}$$

$$\text{Hint: } L_3 = \{a^n b^m : n < m\} \cup \{a^n b^m : n > m\}$$

$$L_4 = \{c u c v c : |u| = |v|, u, v \in \{a, b\}^*\}$$

What is  $L_1 \cap L_2$ ?

## Announcements:

Assignment 3 has been posted.

If you do the 10 point bonus question, make sure you submit your code on connex.

Midterm: **Wednesday** June 27, in class.

Midterm tutorial?

Old midterms are available from the course web page.

Assignment #1 and #2 solutions are available in the connex resources.

# Pushdown Automata

Figure 7.4 A push-down automaton

Picture from: Torsten Schaßan

## Pushdown Automata:

A pushdown automaton is like a NDFA which has a stack.

Every context-free language has a pushdown automaton that accepts it.

This lecture starts with some examples, gives the formal definition, then investigates PDA's further.

# Stacks

Stack Data Structure: permits push and pop at the top of the stack.

$$L = \{ w c w^R : w \in \{a, b\}^* \}$$

Start state:  $s$ , Final State:  $\{t\}$

| State | Input | Pop        | Next state | Push       |
|-------|-------|------------|------------|------------|
| $s$   | $a$   | $\epsilon$ | $s$        | $A$        |
| $s$   | $b$   | $\epsilon$ | $s$        | $B$        |
| $s$   | $c$   | $\epsilon$ | $t$        | $\epsilon$ |
| $t$   | $a$   | $A$        | $t$        | $\epsilon$ |
| $t$   | $b$   | $B$        | $t$        | $\epsilon$ |

To accept, there must exist a computation which:

1. Starts in the start state with an empty stack.
2. Applies transitions of the PDA which are applicable at each step.
3. Consumes all the input.
4. Terminates in a final state with an empty stack.

$w = a b b c b b a$

$(s, abbcbbba, \varepsilon) \vdash^*$

$(s, cbba, BBA) \vdash$

$(t, bba, BBA) \vdash^*$

$(t, \varepsilon, \varepsilon)$

Stack is  
knocked  
over like  
this:

A **pushdown automaton** is a sextuple

$M = (K, \Sigma, \Gamma, \Delta, s, F)$  where

$K$  is a finite set of states,

$\Sigma$  is an alphabet (the **input symbols**)

$\Gamma$  is an alphabet (the **stack symbols**)

$\Delta$ , the transition relation,

is a finite subset of

|              |          |                              |          |            |          |                   |          |             |
|--------------|----------|------------------------------|----------|------------|----------|-------------------|----------|-------------|
| $(K$         | $\times$ | $(\Sigma \cup \{\epsilon\})$ | $\times$ | $\Gamma^*$ | $\times$ | $(K$              | $\times$ | $\Gamma^*)$ |
| <b>state</b> |          | <b>input</b>                 |          | <b>pop</b> |          | <b>next state</b> |          | <b>push</b> |

A **configuration** of a PDA is a member of

$$\mathbf{K} \quad \times \quad \Sigma^* \quad \times \quad \Gamma^*$$

**current state**      input remaining      **stack**

A configuration  $(q, \sigma w, \alpha x)$   $\vdash$   $(r, w, \beta x)$  if  $((q, \sigma, \alpha), (r, \beta)) \in \Delta$ .

For  $M = (K, \Sigma, \Gamma, \Delta, s, F)$ ,

**$L(M)$**  (the language accepted by  $M$ ) =

$\{ w \in \Sigma^* : (s, w, \varepsilon) \vdash^* (f, \varepsilon, \varepsilon) \text{ for some final state } f \text{ in } F \}$ .

$L(M) = \{ w \in \Sigma^* : (s, w, \varepsilon) \vdash^* (f, \varepsilon, \varepsilon) \text{ for some final state } f \text{ in } F \}.$

To accept, there must exist a computation which:

1. Starts in the start state with an empty stack.
2. Applies transitions of the PDA which are applicable at each step.
3. Consumes all the input.
4. Terminates in a final state with an empty stack.

PDA's are non-deterministic:

$$L = \{ w w^R : w \in \{a, b\}^* \}$$

Start state:  $s$ , Final State:  $\{t\}$

| State | Input      | Pop        | Next state | Push       |
|-------|------------|------------|------------|------------|
| $s$   | $a$        | $\epsilon$ | $s$        | $A$        |
| $s$   | $b$        | $\epsilon$ | $s$        | $B$        |
| $s$   | $\epsilon$ | $\epsilon$ | $t$        | $\epsilon$ |
| $t$   | $a$        | $A$        | $t$        | $\epsilon$ |
| $t$   | $b$        | $B$        | $t$        | $\epsilon$ |

Guessing  
wrong time to  
switch from  $s$   
to  $t$  gives  
non-accepting  
computations.

$L = \{w \text{ in } \{a, b\}^* : w \text{ has the same number of } a\text{'s and } b\text{'s}\}$

Start state:  $s$

Final states:  $\{s\}$

| State | Input | Pop        | Next state | Push       |
|-------|-------|------------|------------|------------|
| $s$   | $a$   | $\epsilon$ | $s$        | $B$        |
| $s$   | $a$   | $A$        | $s$        | $\epsilon$ |
| $s$   | $b$   | $\epsilon$ | $s$        | $A$        |
| $s$   | $b$   | $B$        | $s$        | $\epsilon$ |

$L = \{w \text{ in } \{a, b\}^* : w \text{ has the same number of } a\text{'s and } b\text{'s}\}$

State state:  $s$ , Final states:  $\{f\}$

| State | Input      | Pop        | Next state | Push       |
|-------|------------|------------|------------|------------|
| $s$   | $\epsilon$ | $\epsilon$ | $t$        | $X$        |
| $t$   | $a$        | $X$        | $t$        | $BX$       |
| $t$   | $a$        | $A$        | $t$        | $\epsilon$ |
| $t$   | $a$        | $B$        | $t$        | $BB$       |
| $t$   | $b$        | $X$        | $t$        | $AX$       |
| $t$   | $b$        | $A$        | $t$        | $AA$       |
| $t$   | $b$        | $B$        | $t$        | $\epsilon$ |
| $t$   | $\epsilon$ | $X$        | $f$        | $\epsilon$ |

A more  
deterministic  
solution:

Stack will  
never contain  
both  $A$ 's and  
 $B$ 's.

$X$ - bottom of  
stack marker.

1. Draw a parse tree for the following derivation:

$$\begin{aligned} S &\Rightarrow C A C \Rightarrow C A b b \Rightarrow b b A b b \Rightarrow \\ &b b B b b \Rightarrow b b a A a a b b \\ &\Rightarrow b b a b a a b b \end{aligned}$$

2. Show on your parse tree  $u, v, x, y, z$  as per the pumping theorem.

3. Prove that the language for this question is an infinite language.
